Freelance Content Creator Escrow Platform

Scenario

A platform connects clients with freelance content creators such as writers, graphic designers, video editors, and photographers. A client can create a project by specifying requirements, budget, deadline, and deliverables. Freelancers can browse available projects and submit proposals.

The client selects a freelancer and creates a contract. Before the freelancer starts the work, the client deposits the agreed amount into an escrow account. The freelancer submits the completed work through the platform. The client can approve the work or request revisions.

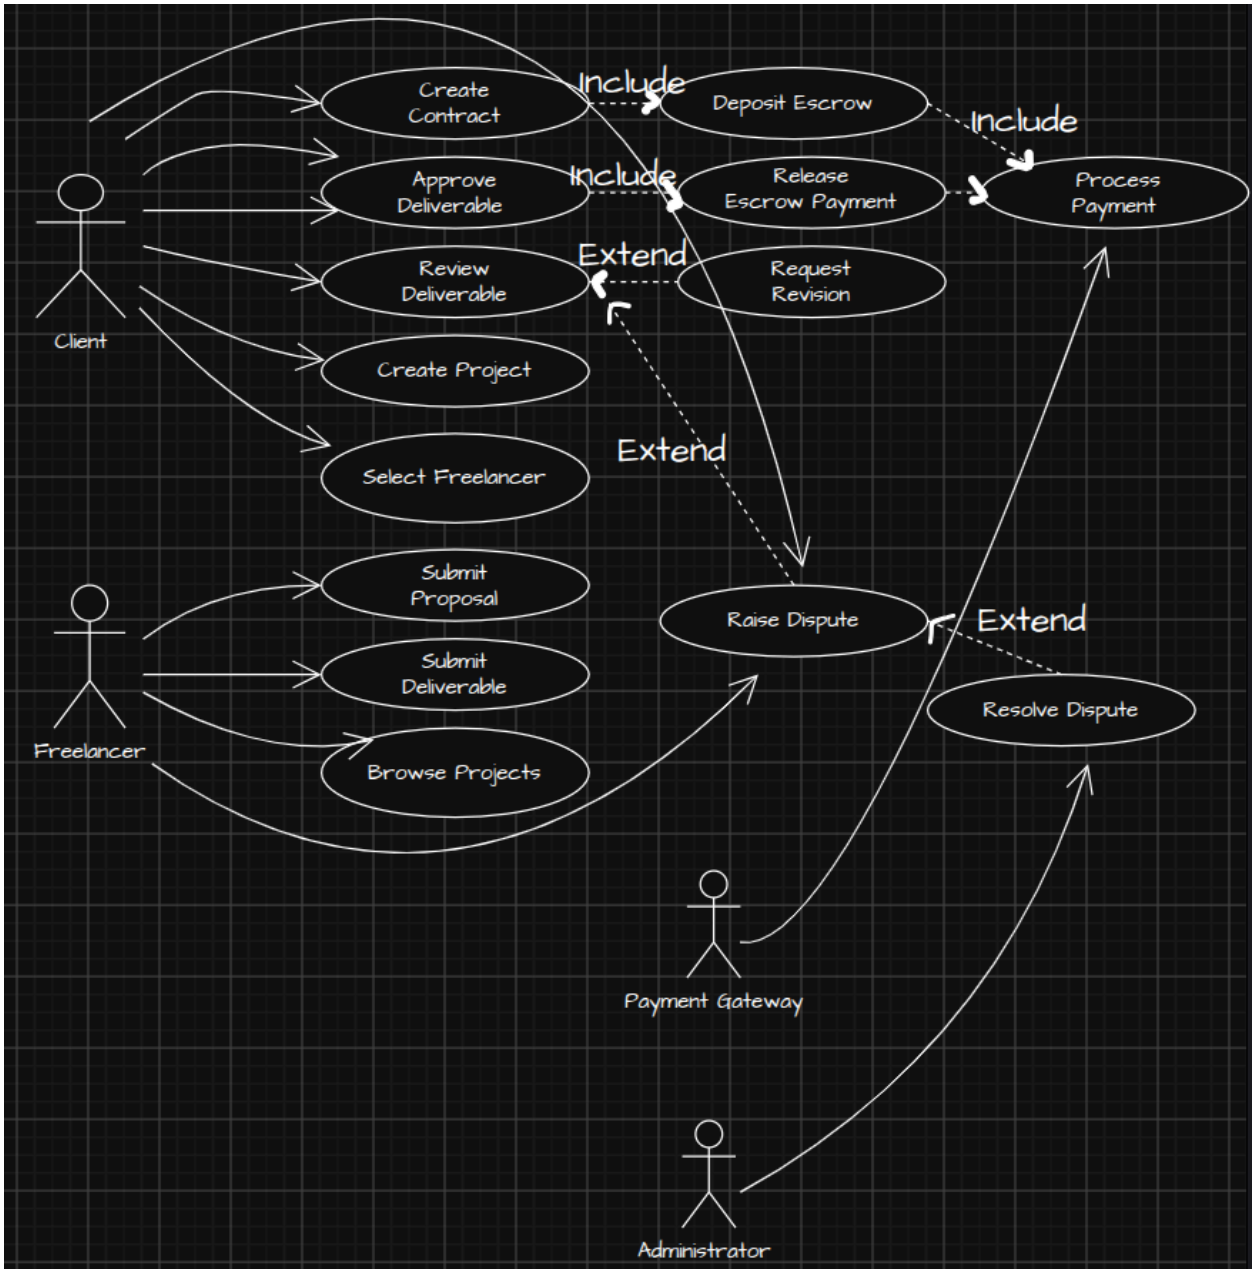

Once the client approves the final deliverable, the escrow amount is released to the freelancer. If the client and freelancer disagree about the work, either party can raise a dispute. An administrator reviews the dispute and decides how the escrow amount should be handled.

Complete Requirements Table:

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale (short)	Comments
FR-001	Functional	The platform should allow the freelancers to browse available projects and submit their proposals.	High	When a freelancer searches for a project, the system displays all available projects matching the specified topic or category.	Core Requirement - Enables freelancers to find projects	-

FR-002	Functional	The platform should allow the clients to create a project by specifying requirements, budget, deadline, and deliverables	High	*When a client submits a project, the system validates the required requirements, budget, deadline, and deliverables before publishing it.*	Core Requirement - Defines clear project requirements	-
FR-003	Functional	The client should be able to select a freelancer and create a contract.	High	When a client selects a freelancer, the system generates a contract containing the agreed project terms and makes it available to both parties.	Establishes agreed contractual terms	-
FR-004	Functional	The freelancer should be able to submit completed work through the platform, and the client should be able to approve the work or request revisions.	High	When a freelancer submits completed work, the client is notified and can approve the work or request revisions.	Ensures deliverable review and approval	-
FR-005	Functional	The platform should release the escrow payment to the freelancer when the client approves the final deliverable.	High	When the client approves the final deliverable, the system releases the escrowed payment to the freelancer.	Ensures secure payment settlement	-
NFR-001	Non-functional	The platform should ensure that user data, project details,]payment information are securely stored and protected from unauthorized access.	High	When user or payment data is accessed, the system restricts access to authorized users and protects the data from unauthorized access.	Protects sensitive user information	-
NFR-002	Non-functional	The platform should provide a responsive user interface, with pages loading and user actions completing within **3 secs**	Medium	When a user performs an action, the system shall provide the corresponding response within 3 seconds under normal operating conditions.	Ensures responsive user experience	-

UML Use-Case Diagram:

Use-Case Flow Specification:

Use Case: Approve Deliverable and Release Escrow Payment

Actors: Client, Freelancer, Payment Gateway

Brief Description: The Client reviews the Freelancer's submitted work. If it meets the requirements, the Client approves it and the escrow payment is released to the Freelancer.

Preconditions

1. A contract exists between the Client and Freelancer.
2. The agreed payment is held in escrow.
3. The Freelancer has submitted the deliverable.
4. The Client is logged in and authorized.

Postconditions

- **Success:** The deliverable is approved, payment is released, and the contract is marked as completed.
- **Alternate:** If changes are needed, a revision is requested and the payment remains in escrow.

Main Success Scenario

1. The Client opens the active contract and views the submitted deliverable.
2. The system displays the work and project requirements.
3. The Client reviews the deliverable.
4. The Client selects **Approve Deliverable**.
5. The system verifies the Client's authorization.
6. The system marks the deliverable as **Approved** and the contract as **Completed**.
7. The system releases the escrow payment to the Freelancer through the Payment Gateway.
8. The system records the transaction and notifies both parties.

Alternate Flow A1: Request Revision

1. The Client selects **Request Revision** instead of approving.
2. The Client enters revision comments.
3. The system marks the deliverable as **Revision Requested** and keeps the payment in escrow.
4. The Freelancer is notified and resubmits the revised work.
5. The Client reviews the revised deliverable again.

Business Rules

- Only the Client assigned to the contract can approve or request revisions.
- Payment remains in escrow until the deliverable is approved.
- If payment release fails, the approval should not be finalized.
